

## What is RegistryBuilder?

Whether a patient registry, disease registry, or clinical registry, with RemedyMD's RegistryBuilder™ you can easily build your registry and be up and running in days (not months or years).

Use RegistryBuilder's intuitive user interface to configure your registry and load your data with no technical skills, programmers, or IT personnel needed.

With RegistryBuilder, you can:

- Configure a web-based registry so that you can access it from anywhere and collaborate with multiple locations - avoiding messy and time-consuming installations.
- Quickly and easily build sophisticated electronic data collection forms that include lists of values, context sensitivity, formulas, default values and more.
- Build powerful reports to analyze the data you are collecting.
- Control access to your registry by creating end-users and assigning them access roles that you define.
- Configure a subject/patient portal that includes electronic registration, forums, chat rooms, HIPAA-compliant messaging, document sharing, journaling, and more.

## Where is the Value?

### Start collecting your data now

**HOW?** With RegistryBuilder you choose fields from a pre-populated dictionary of standard biomedical concepts to quickly build your personalized data collection forms. With no programming, you get the validations, default values, interventional alert messages, formatting and much more for all your data. If the concept you need is not in the dictionary, you can quickly add it and continue to ensure consistency across your registries.

### Benefit from data you have in other systems

**HOW?** Whether an EMR, a spreadsheet, a local database, or any other source, with RegistryBuilder you can easily incorporate your existing data with the data you are collecting in the registry for a complete view. You can implement a one-time load of your data or a recurring interface to another system. Either way, you can do it all without IT specialists or programmers.

### Do powerful analysis and reporting

**HOW?** Quickly build powerful standard or ad-hoc reports on the data you collect. Since RegistryBuilder is designed for biomedical information, you can do advanced reporting such as reporting on all the autoimmune diseases without having to list them all.

## Technically Speaking

- Your registries built with RegistryBuilder use the latest Microsoft Silverlight technology so that they are secure, easy to use, and exceptionally fast.
- Your registry data is stored in an Oracle database that is private and secure. Your data is continuously backed up so no loss of data is possible.
- Your registry and your data are located in a class 1 secure facility to ensure it is always available and private.
